

BUG REPORT

- **BUG No1.:** The same message is showing for a different error.

Description: On the login screen, the same error message is shown for different errors. The message “Incorrect username or password” is shown when the data is actually incorrect and also when the user tries to submit an empty login form. In that case, the message should be something like ‘Email and password are required’.

Steps:

1. Open the website
2. Enter invalid data in the login form
3. Leave the login form empty
4. Click ‘Submit’
5. Confirm error message is showing

- **BUG No2.:** Required fields are not marked

Description: On the sign-up screen all fields are required but they are not marked with ‘*’ which is the usual practice. But if the user tries to submit the form without populating all fields he will receive an error message that the field is required.

Steps:

1. Open the website
2. Click on the signup button
3. Confirm that fields are not marked
4. Leave one of the fields empty
5. Click ‘Submit’ button
6. Confirm that the error message is showing

- **BUG No3.: Required fields are not marked**

Description: On the sign-up screen password in the form has a minimum length of 7 characters, but that isn't anywhere declared to the user. This rule the user can see only in an error message if the entered password is shorter

Steps:

1. Open the website
2. Click on the signup button
3. In the 'Password' input field enter a password shorter than 7 characters
4. Click 'Submit' button
5. Confirm that the error message is showing

- **BUG No4.: Whole entered password is showing in the error message**

Description: On the sign-up screen password in the form has a minimal length of 7 characters, but that isn't anywhere declared to the user. This rule the user can see only in an error message if the entered password is shorter and when the message is showing, the whole password that has been entered is written in the message, and that isn't a good practice

Steps:

1. Open the website
2. Click on the signup button
3. In the 'Password' input field enter a password shorter than 7 characters
4. Click 'Submit' button
5. Confirm that the error message is showing

- **BUG No5.: Adding the same contact more times**

Description: After the user is successfully logged in and can add new contacts. It is possible to add contact with all the same information more time and that should not be the case.

Steps:

1. Open the website
2. Login with valid data
3. Click the 'Add new contact' button
4. Full out the form and submit
5. Repeat the same process one more time using all the same data

- **BUG No6.: Authorization – session**

Description: When the user has been logged in for some time in the application and the session ended, the user isn't signed out and no message/notification is shown to the user. Instead, if the user tries to add a new contact or edit an existing one, he isn't able to. In the console tab at that moment, there is an 'Unauthorized' error, but still user isn't redirected to the login page. This can be a problem for users without technical knowledge, it can be confusing.

- **BUG No7.: Sorting not working the way it should**

Description: When the user is logged in and has a Contact list with multiple contacts, this problem can be seen. Alphabetical sorting is case-sensitive. Meaning, if we have contacts like 'Aa Aa', 'ab aa', and 'N N' common sense says that the order should be as written but it isn't. On the page, contacts are showing in the next order: 'Aa Aa', 'N N', 'ab aa'

Steps:

6. Open the website
7. Login with valid data
8. Check how the contacts are sorted
